Kumar Mehul

(+91)7550125001 | Ranchi, India (Open to Relocation) | kumar-mehul_1@outlook.com | kmehul.github.io | linkedin.com/in/kmehul992/

PROFILE SUMMARY

- Data Analytics professional focused on data extraction, preparation, visualization, data quality management, and business intelligence, with 8 months as a Data Analyst in the nonprofit sector, plus hands-on work on independent analytical projects.
- Uses SQL, Python, Tableau, and Power BI to build analytical datasets, validate data quality, design dashboards, and prepare reports.
- Grounded in data engineering fundamentals (ETL, dimensional modeling, data warehousing), applied to large, multi-source datasets.
- Communicates progress through recurring written status reports and uses AI tools (ChatGPT, Claude) with review of AI output.

CORE COMPETENCIES

Data Analysis | Data Visualization | Dashboard Development | Business Intelligence | Data Quality Management | Data Validation | Data Modeling | Data Warehousing | ETL Processes | Analytical Reporting | Database Management | Documentation

TECHNICAL SKILLS

Analytics & Visualization: Tableau, Power BI | Dashboards, KPIs, Drill-downs, Ad-hoc analysis, Data storytelling

Languages: SQL, Python (pandas, matplotlib, seaborn) | Data manipulation, Data cleaning, Querying, Exploratory data analysis

Data Preparation: Alteryx, Talend | ETL, Data profiling, Data transformation, Data integration, Data quality

Databases: PostgreSQL, SQL Server, Azure SQL, MySQL, E/R Studio | Relational databases, Dimensional modeling, Data warehousing

WORK EXPERIENCE

Data Analyst | Rebecca Everlene Trust Company | Chicago, USA (Remote) *Oct 2024 - May 2025*

- Constructed a grants intelligence dataset by extracting and structuring data from IRS 990 filings and foundation websites for approximately 2,000 of the team's 8,000 organization records, feeding into the team's auditing, gap analysis, and enrichment work.
- Audited the full foundation dataset for structural integrity and formatting consistency, identifying and resolving field-level inconsistencies across all records to ensure data reliability for downstream grant prioritization and outreach decisions.
- Conducted a structured gap analysis across the complete dataset, maintaining a resolution log through multiple review cycles and applying an established triage methodology to focus follow-up on recoverable gaps and close out permanently incomplete records.
- Developed a deadline-driven classification framework segmenting approximately 6,300 of the 8,000 foundations across a 12-month grant pipeline, enabling prioritization by application window and replacing an unstructured process with a team-wide workflow.
- Enriched the finalized dataset by cross-referencing a centralized document repository against each foundation's requirements, producing submission-ready grants packages for approximately 80% of assigned foundations ahead of reporting deadlines.

PROJECTS

Jersey City Last-Mile Mobility Analysis | PostgreSQL, Python (pandas, matplotlib, seaborn), Tableau *Jun 2026 - Jul 2026*

- Built reusable PostgreSQL CTE views for station-level flow, imbalance, and coordinate mapping, with Claude as a code reviewer to independently reproduce results, catching a NULL-handling bug and a sign error affecting 44 of 81 stations before publishing.
- Cleaned a 95,350-row trip dataset in Python (pandas), removing 355 null records and 306 cross-system anomalies to produce 94,689 verified trips, recomputed station and rider metrics, and built heatmaps and charts for non-technical stakeholders.
- Applied a two-stage reliability filter (more than 25 daily rides on at least 6 of 31 days), narrowing the ranking from 84 to 81 stations, and published a Tableau dashboard of all 108 stations by flow direction, imbalance, and reliability, flagging 27 low-volume stations so stakeholders can prioritize rebalancing.
- Quantified station-level imbalance to identify 10 priority stations with daily imbalance up to 17.8%, then translated findings into two city-separated rebalancing routes, converting a network-wide problem into two operationally distinct interventions.

IMDB Movie Data Analysis | Alteryx, Talend, Tableau, Azure SQL, E/R Studio *Dec 2023 - Apr 2024*

- Designed a 12-table dimensional model in E/R Studio - 6 dimensions, 2 fact tables, and 4 bridge tables resolving multivalued fields such as genres and cast and crew credits - to support analysis of movie titles, ratings, and box office performance.
- Profiled and validated source data in Alteryx, removing 20%+ irrelevant columns before load, cutting storage and query time, then built Talend jobs to stage, transform, and load ~1 million records from 17 heterogeneous sources (6 SQL tables, 2 JSON files, 9 TSV box office files) into Azure SQL, expanding many-to-many relationships into bridge rows for a ~8.9 million-record warehouse.
- Created Tableau dashboards surfacing four areas - genre-level rating and revenue patterns, multi-year output and rating trends, seasonal release performance, and multi-region release footprint - letting stakeholders explore the full catalog without writing SQL.

EDUCATION

Master of Science in Information Systems | Northeastern University, Boston, USA *Sep 2022 - May 2024*

Bachelor of Technology in Information Technology | SRM Institute of Science and Technology, Chennai, India *Jul 2016 - May 2020*
